An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 130 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forenssi, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

```
from (1) can be used for determining the presence of a nucleic acid which hybridises to (1), and for determining the phenotype of cells in a sample of cells from a patient. (1) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate carractory or a solid surface, to identify a chromosome on which the corresponding gene recides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (1) can be used to raise antibodies, and to screen for peptide analogues and antagonists.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 10, 3

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an
          essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus fungatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAUI5053-AAUI5113 represent proteins encoded by C. albicans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional

                                                          The present sequence represents a Candida albicans protein. The specification describes genes CaDRA472, CaDR489, 1CaDR527, 2CaDR527, CaNL260, and CaDR361. These genes are essential for carload, CaNL260, and CaDR361. These genes are sesential for candida albicans genes and their derived proteins are used to screen compounds ablicans genes and their derived proteins are used to screen compounds antibugal activity. The proteins are also used to generate a protective antibody response against fungal infections in mammals. The Candida albicans and genes, and their antibodies, are used for diagnosing fungal infections, specifically C. albicans (in standard amplification, hybridisation or immunological assays, and for studying

         expressible selectable marker and modifying other allele by
recombination, of a promoter replacement fragment with a heterologous
promoter, so that expression of the second allele is regulated by the
promoter. [Mi] is useful for constructing a strain of diploid fungal
cells in which both alleles modified are useful for identifying a gene that
cells having both alleles modified are useful for identifying a gene that
is essential to the survival or growth of a fungus, a gene that
contributes to the virulence and/or pathogenicity of a fungus, a gene
that contributes to the resistance of a diploid fungus to an antifungal
agent, an antifungal agent that inhibits the growth of a diploid fungus
and for identifying a therapeutic agent for treatment of a mammalian
clisease. [MI] is useful for identifying a compound which modulates the
activity of a gene product, preferably enzymatic activity, carbon
cativity. The method is useful for identifying a compound having the
activity. The method is useful for identifying a compound having the
activity. The method is useful for identifying a compound having the
activity. The sequence data for modification and cell division
activity. The sequence data for this patent is not represented in the princed
sesential Candida albicans protein used in the method of the invention.
Note: The sequence data for this patent is not represented in the princed
the Buropean Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WLSHIDOYNNSSSLRNHLNNLEDIMAQISITNGDKEVEDYEKNIKKARNKLRVIASITKE 120

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tage for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating insiders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human of the polypepticalication, but was obtained in electronic format directly from WIPO are fire into into the polypeptics.
                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      at ftp.wipo.int/pub/published_pct_sequences

Sequences ABA08225-ABA06230 represent 1300 moves internal polypeptides, and sequences ABA08225-ABA06230 represent nucleic acids encoding them. The invention also relates to vectors and recombinath host cells comprising a nuclectide of the invention, methods of detecting the nuclectides, antibodies against the polypeptides, methods of detecting the nuclectides of the invention. Although novel, many of the polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby cylving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell differentiation activities; seem cell growth factor activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activities; playeptides activities; chemotactic or chemokiner; activities; playeptides activities; chemotactic or chemokiner; activities; playeptides and nucleotides of thrombolypric activities; activities; polypeptides and nucleotides of conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., orteoporosis), and abnormal carefular growth. Polypeptides involved with tissue regeneration and vascular growth. Polypeptides encoding them) may be used to promote wound conditions in addition to immunochulatory activities may be used in the treatment of viral, bacterial infections in addition to immune disease with growth factor activity may be used to promote wound conditions and ulcers), while those with growth factor activity may be used in the treatment of viral, bacterial and fungal infections in addition to immune disease or accidental damage. The propeptides with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and

Zhao QA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Xue AJ,
                                                                              The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        treatment of cancer, leukaemia, nervous system disorders, arthritis and
inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CALCHARTON OF SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to eytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        179

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

                                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences.
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectioides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

```
The invention relates to an isolated polynuclectide (I) comprising a nuclectide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynuclectides are useful coding protein or complementary sequences. The polynuclectides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP68849) are useful as molecular weight markers, as food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (Parkinson's or Alzhaimer's disease), autojimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, indigal, parasitic), arthritis, etc.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. At the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           626 GALOGKVEEDLELLDKSFETLADOTEWOSSHLFKYFQEVVQLWEAHOSELLVQELELEKR 685
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell-proliferative disorder; neurodegenerative disease; bacterial;

The present invention relates to a new gene expression cassette comprising a secretory leader sequence encoding a signal peptide from clostridium difficile or signal peptides of analogous exported clostridium difficile or signal peptides of analogous exported clostridium difficile or signal peptides of analogous exported states and/or secreting them into the surroundings of the expression cassette is useful for presenting polypeptides on the surface of bacterial cells, and/or secreting them into the surroundings of the cells, for mucosal immunisation, induction of immunological tolerance and anti-tunour therapy in humans and animals, as vaccines, and for the treatment of prevention of fibrinolysis in arterial or venous occlusion and/or revitalising gangrenous or necrotic tissue in various diseases. The gene expression cassette may also be used to produce in the gut, e.g. peptides and enzymes for therapy and prophylaxis of various diseases; single, fusion or multiple polypeptide antigens of microbial, animal or mammalian or manmalian or manmalian or manmalian or injun for neonatal immune balanching, vaccination and carrier molecules separated or fused to the antigen to amplify or modulate immune response. Spores produced by calculations, e.g. Clostridium difficile are useful for both industrial production of vaccines and for local production of the desired polypeptides at the body sites desired. ```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signaling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pot_sequences.

The present invention relates to a new gene expression cassette comprising a secretory leader sequence encoding a signal peptide from Clostridium difficile or signal peptides of analogous exported clostridial N-acetylmuramoyl-L-alanine amidase-like proteins, linked clostridial N-acetylmuramoyl-L-alanine amidase-like proteins, linked comprises on cassette is useful for presenting polypeptides on the surface of bacterial cells, and/or secreting them into the surroundings of the cells, for mucosal immunisation, induction of immunological tolerance and anti-tunmour therapy in humans and animals, as vaccines, and for the treatment of prevention of fibrinolysis in arterial or venous occlusion and/or revitalising gangrenous or necrotic tissue in various diseases. The gene expression cassettem may also be used to produce in the gut, e.g. peptides and enzymes for therapy and prophylaxis of various diseases; single, fusion or multiple polypeptide antigens of microbial, animal or mammalian origin for neonatal immune balancing, vaccination animal or mammalian origin for neonatal immune balancing, vaccination animal or mammalian origin for neonatal immune balancing, vaccination animal or manimulate immune response. Spores produced by animal or manimulate immune response. Spores produced by clostridia, e.g. clostridia, e.g. clostridia, e.g. clostridia, e.g. clostridia, e.g. clostridia, e.g. clostridia, e.g. clostridia, e.g. complete and for local production of the desired polypeptides at the body sites desired. AMU12017-AMU12048 represent c.g. chifficile S-layer protein cell wall binding portions encoded by corpus respectively. The DNAs encoding these portions may be used in a respectively. The DNAs encoding these portions may be used in a cappane or the present invention.
                                                                                                                                                                                Gene expression cassette; secretory leader sequence; anti-tumour therapy; clostridial N-acetylmuramoy1-b-alamine amidase-like protein; cytostatic; fibrinolysis; gangrenous tissue; necrotic tissue; infection; S-layer protein cell wall binding portion; ORF6.
                                                                                                                                   Clostridium difficile S-layer protein cell wall binding portion (ORF6).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New gene expression cassette comprising a secretory leader sequence encoding a signal peptide from Clostridium difficile, useful e.g. for presenting polypeptides on bacterial cell surface, or as anti-tumour

The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Sequence 1, Application US/08916421B
Patent No. 6503729
GENERAL INFORMATION:
GENERAL INFORMATION:
TILLE OF INVENTION: Complete Genome Sequence of the Methanogenic Archaeon, Methanoci
Patent No. 6503729
TILLE OF INVENTION: januaschii
FILE REPERENCE: PB275
CURRENT APPLICATION NUMBER: US/08/916,421B
CURRENT PILING DATE: 1997-080-22
PRIOR PATICATION NUMBER: US 60/024,428
PRIOR FILING DATE: 1996-08-22
